```
print('1차 모델 : ', TE_Err_1)
print('5차 모델 : ', TE_Err_5)
print('9차 모델 : ', TE_Err_9)
```

```
1차 모델 :  6044.176547629271
5차 모델 :  4330.604566409499
9차 모델 :  4238.689067137633
```

IV. Validation Approach

- import Packages

```
import pandas as pd
```

- pandas DataFrame

```
url = 'https://raw.githubusercontent.com/rusita-ai/pyData/master/Electric.csv'

Elec = pd.read_csv(url)
```

```
Elec.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 768 entries, 0 to 767
Data columns (total 9 columns):
 #   Column                    Non-Null Count  Dtype  
---  ------                    --------------  -----  
 0   compactness               768 non-null    float64
 1   surface_area              768 non-null    float64
 2   wall_area                 768 non-null    float64
 3   roof_area                 768 non-null    float64
 4   height                    768 non-null    float64
 5   orientation               768 non-null    int64  
 6   glazing_area              768 non-null    float64
 7   glazing_area_distribution  768 non-null    int64  
 8   electricity               768 non-null    float64
dtypes: float64(7), int64(2)
memory usage: 54.1 KB
```

Train vs. Validation vs. Test

- 6:2:2 Split(462:153:153)

sklearn Package 사용

- train_test_split( )

- 20% Test_Data(153)

```
from sklearn.model_selection import train_test_split

X_remain, X_test, y_remain, y_test = train_test_split(Elec[['surface_area']],
                                                      Elec['electricity'],
                                                      test_size = int(len(Elec) * 0.2),

```

1) 5차 모델 Validation Error

- Train_Data로 모델 생성

```
from sklearn.preprocessing import PolynomialFeatures

poly = PolynomialFeatures(degree = 5, include_bias = False)
PX_5_TR = poly.fit_transform(X_train)
```

```
from sklearn.linear_model import LinearRegression

Model_5 = LinearRegression()
Model_5.fit(PX_5_TR, y_train)
```

```
LinearRegression(copy_X=True, fit_intercept=True, n_jobs=None, normalize=False)
```

- Validation_Data로 y_hat(예측값) 생성 및 MSE 계산

```
PX_5_VD = poly.fit_transform(X_valid)

y_hat_5 = Model_5.predict(PX_5_VD)
```

```
from sklearn.metrics import mean_squared_error

MSE_5 = mean_squared_error(y_valid, y_hat_5)
MSE_5
```

```
4136.4312593408395
```

2) 9차 모델 Validation Error

- Train_Data로 모델 생성

```
from sklearn.preprocessing import PolynomialFeatures

poly = PolynomialFeatures(degree = 9, include_bias = False)
PX_9_TR = poly.fit_transform(X_train)
```

```
Model_9 = LinearRegression()
Model_9.fit(PX_9_TR, y_train)
```

```
LinearRegression(copy_X=True, fit_intercept=True, n_jobs=None, normalize=False)
```

- Validation_Data로 y_hat(예측값) 생성 및 MSE 계산

```
PX9_valid = poly.fit_transform(X_valid)

y_hat_9 = Model_9.predict(PX9_valid)
```

```
MSE_9 = mean_squared_error(y_valid, y_hat_9)
```

```
MSE_9 = mean_squared_error(y_valid, y_hat_9)
MSE_9
```

```
3955.9733124909912
```

3) 2개 모델 Validation Error 비교

```
print('5차 모델 MSE_5  : ', MSE_5)
print('9차 모델 MSE_9  : ', MSE_9)
```

```
5차 모델 MSE_5  :  4136.4312593408395
9차 모델 MSE_9  :  3955.9733124909912
```

4) 최종 9차 모델을 Test_Data에 적용

- Test_Data로 y_hat(예측값) 생성 및 MSE 계산

```
PX9_TE = poly.fit_transform(X_test)
mean_squared_error(y_test, Model_9.predict(PX9_TE))
```

```
4220.88573210769
```
